**Keywords**: Iodine-mediated Cyclization; Iododihydropyrrole; Lithium Carbonate; 4-Amino-1-butyne; Modification

Development of the synthesis of iodine-containing compounds is important under environmentally benign and inexpensive conditions. Ding and co-workers reported that iododihydropyrroles were obtained by the reaction of *N*-tosyl-4-amino-1-butynes with iodine and potassium carbonate in the presence of silver acetate, which is somewhat expensive. Herein, we will report the simple methods without silver acetate.

We examined the reaction of *N*-tosyl-4-amino-1-butynes without silver acetate (Table 1). Iodine monochloride was not a suitable source of iodine (Entries 1 and 2). The yield was improved with 3 equivalents of iodine under reflux conditions (Entries 3-8). Using lithium carbonate as the base, the yield was significantly improved (Entry 10). Those reaction conditions exceeded the yield of the reported method (69%).<sup>1)</sup>

We also examined the substituent effect on triple bond (Scheme 1). The excellent yield was obtained in *m*- and *p*-substituents whereas the *o*-substituent gave low yield. Both electrondonating (Me) and electron-withdrawing (CF<sub>3</sub>) substituents gave the good yield. But the complex mixture was obtained in the case of Ph substituent on nitrogen atom instead of Ts group. It suggests that the achievement of the iododihydropyrrole

Ph I source, base Ph Ph

Entry	I source (x equiv.)	Base	Temp.	Yield (%) <sup>a)</sup>
1	ICI (3.0)	NaHCO <sub>3</sub>	r.t.	trace
2	ICI in aq. HCI (3.0)	NaHCO <sub>3</sub>	r.t.	0
