

A change of the crustal vertical ground deformation estimated from the repetition observation of a leveling

*Kazutomo Takano¹

1.GSI of Japan

The Geospatial Information Authority of Japan (GSI) is carrying out the repetition observation of a leveling in the Tokai region from Morimachi to Omaezaki. In the present study, I conducted the examination from the observation of the leveling about the anomalous vertical ground deformation considered to have generated in this region around 2000 to 2005.

Keywords: leveling, crustal vertical deformation, Tokai region
