[EE] Evening Poster | H (Human Geosciences) | H-GM Geomorphology

## [H-GM02]Geomorphology

convener:Tsuyoshi Hattanji(Faculty of Life and Environmental Sciences, University of Tsukuba),  
Masayuki Seto(Fukushima Future Center for Regional Revitalization, Fukushima University), Hiroshi  
Shimazu(立正大学地球環境科学部地理学科)

Wed. May 23, 2018 5:15 PM - 6:30 PM Poster Hall (International Exhibition Hall7, Makuhari Messe)

The main subject of this session is interdisciplinary discussion on the whole range of themes relating to geomorphology, especially geomorphic processes, landform development and its relation to environmental changes, geomorphological hazards and their mitigation, relationships among geomorphic processes, other natural phenomena and human activities, and various techniques of geomorphological measurements and landform classification. All presentations and discussion of this session are made in English.

## [HGM02-P06]Coastal Geomorphology of Ujung Genteng Tombolo Sukabumi Regency

\*intan elvira<sup>1</sup>, Sunarto Sunarto<sup>1</sup> (1.UGM)

Keywords:Geomorphology, Coastal Geomorphology, Tombolo

*The aims of this research are 1) to identify the morphology of Ujung Genteng tombolo 2) to identify the materials that form the Ujung Genteng tombolo 3) to analyze the geomorphology process on the Ujung Genteng tombolo. The collected data that are needed in this research such as morphology, material, and process. The morphology aspects are consist of sloping classification, sloping shape, and onshore topography. The material aspect is consist of uncompacted sediment. The process aspect contains type of geomorphology process, breaking type, tidal classification, wind-speed and onshore genesis. The morphology and material data are collected by the direct measurement and UAV record. The process data are obtained by the direct measurement and related academic literatures. The additional data are also obtained by direct interview with the local people and direct observation. The result shows that the geomorphology of Ujung Genteng tombolo has the wavy type of surface relief with the flat slope class. The materials that form the tombolo such as marine sand, volcanic deposit sand, alluvial deposit, and coral limestone. Based on the process aspect, the tombolo area refers to the sedimentation process with a dissipative shore type. The landform's various on Ujung Genteng tombolo has the potential to be developed into a tourism site based on ecotourism wisdom.*
