[JJ] Evening Poster | M (Multidisciplinary and Interdisciplinary) | M-GI General Geosciences, Information Geosciences & Simulations

[M-GI28]Development of computational sciences on planetary formation, evolution and surface environment

convener:Yoshi-Yuki Hayashi(Department of Planetology/CPS, Graduate School of Science, Kobe University), Masaki Ogawa(Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo), Shigeru Ida(東京工業大学地球生命研究所, 共同), Kanya Kusano(Institute for Space-Earth Environmental Research, Nagoya University)
Wed. May 23, 2018 5:15 PM - 6:30 PM Poster Hall (International Exhibition Hall7, Makuhari Messe)
Computer simulations have been recognized as one of the fundamental tools in understanding planetary formation, evolution and diversity of surface environment. However, is may be notified that the continuous development of computational abilities in recent years does not seem to be well utilized in improving numerical simulations in those fields; computational efficiency has been improved by 6 orders of magnitude compared from the early 90's, many of our simulations do not seem to catch up qualitatively and quantitatively such improvement. We propose here in this session to ask those who are interested in computational sciences of various fields not only of planetary formation and evolution but also of earth and planetary sciences in general to join. The aim is to discuss various scientific and technical aspects of our numerical simulations to improve our skills to fully utilize those development of computational resources that is realized or will be realized in near future as "K" to "post-K".

[MGI28-P06]Radiative transfer calculation for various planetary atmospheres

*Yoshiyuki O. Takahashi[1], Masanori Onishi[2], George HASHIMOTO[3], Kiyoshi Kuramoto[4], Masaki Ishiwatari[4], Yasuto TAKAHASHI[4], Yoshi-Yuki Hayashi[1] (1.Graduate School of Science, Kobe University, 2.Kyoto University Research Administration Office, 3.Department of Earth Sciences, Okayama University, 4.Department of Cosmosciences, Graduate School of Sciences, Hokkaido University)
Keywords:planetary atmosphere, radiative transfer, Earth, Mars, Venus

A lot of exoplanets have been discovered. One of the interesting questions on those exoplanets is its surface environment and circulation structure. A first step to understand surface environments is an investigation of radiative budget of the planets. But, calculation of radiative transfer of various planets have several difficulties. One of those is huge computational cost, and another is uncertainty of radiative properties of atmospheres which is very different from Earth's atmosphere. In this study, we are developing a radiation model which can be applied to various planetary atmospheres.
In developing a radiation model for atmospheric circulation models, a line-by-line model is developed, first. Then, we develop a radiation model based on correlated k-distribution method, which require much fewer computational cost. The line-by-line calculation is performed with Voigt line profile calculated with Humlicek (1982) method. Gas absorption line parameters are obtained from HITRAN2012 (Rothman et al., 2013). But, for calculation for high temperature condition, absorption line parameters by HITEMP2010 (Rothman et al., 2010) are used. Continuum absorption of water vapor is considered by the use of the MT_CKD model (Mlawer et al., 2012). For calculation for thick carbon dioxide atmosphere, such as Venus atmosphere, collision induced absorption from several sources are used for carbon dioxide. In order to validate the model, radiative fluxes and tendencies are calculated for the Earth, Venus, present Mars, and early Mars. In the presentation, comparison of radiative fluxes and tendencies calculated by our model with those by observation and/or by other models will be presented.
