[M-IS10]Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Atsuhiko Isobe(Research Institute for Applied Mechanics, Kyushu University), Akihisa Kitamura(静岡大学理学部地球科学教室, 共同), Masaki Sano(Faculty of Human Sciences, Waseda University)

Wed. May 23, 2018 5:15 PM - 6:30 PM Poster Hall (International Exhibition Hall7, Makuhari Messe)

Past environmental changes and events at multi-decadal to tectonic timescale toward an understanding of Earth climate system by an integration of terrestrial and marine proxy studies and numerical modeling will be discussed. We welcome a variety of paleo-environmental studies from a wide range of background. In particular, a series of presentations relating to the Anthropocene will be planned. This is a merged session of A-OS31 "Linkage between oceanography and paleoceanography in marginal, shelf and coastal oceans" and M-IS23 "Paleoclimatology and paleoceanography" sessions at JPGU 2017. We hope that this session will provide an opportunity to promote communication between participants from multidisciplinary field.

[MIS10-P29]Response of isotopic composition of Okinawa's precipitation to changes in climate and circulation

*Yuina Uechi¹, Ryu Uemura¹ (1.University of the Ryukyus)

Keywords:stable isotope, precipitation, East Asian Monsoon

The oxygen and hydrogen isotopic composition ($\delta^{18}\text{O}$, δD) in precipitation have been widely used as tracers of hydrological cycle and proxy for the past climate. Many paleoclimate proxies (i.e., isotopic composition in the stalagmites and trees ring) are affected by changes in the isotopic composition in precipitation. However, variations of isotopic composition in precipitation are controlled by many factors and it is not straight forward to interpret their variations. For example, large-scale atmospheric-ocean circulation such as ENSO affects the variation of isotopic composition in precipitation in China (Tan, 2012) and the Galapagos (Martin et al., 2017). Thus, it is essential for understanding of the mechanism of isotope variations in precipitation to interpret the paleoclimate proxies. Here, to understand factors controlling the isotopic composition at a maritime island in the Asian monsoon area, we measured the isotopic composition in precipitation on Okinawa-jima (Japan). Precipitation samples were collected every day over 7 years (Jan. 2011–Dec. 2017) in Okinawa, Japan. This extends the previous weekly observation over 3-year (2008–2011; Uemura et al., 2012) and daily data allows us to evaluate relationship between meteorological factors and isotope composition. The $\delta^{18}\text{O}$ and δD of water were measured using a cavity ring-down spectroscopy. In the presentation we will compare the measured isotopic composition of precipitation with meteorological data and related climate indexes.
