In order to introduce some of the knowledge of geography and research results, we made a brochure on alluvial fans. In the process, we referred to the way of exhibition / introduction about the fan in the local museums and museums and Geopark. The brochure includes geographical viewpoints, introduction of the formation of fans and terraces, features of disaster due to debris flow and flooding, historical circumstances and current situation of land use, regional characteristics considered based on them and ideal land use, and so on.
