Various natural hazards such as floods, slope failures, earthquake motions, etc. occur in the Japanese islands. Such natural hazards greatly affect the state of geosite. The Geopark performs activities in the event of a natural hazard, but its know-how has not accumulated. At Shikoku Seiyō Geopark, the Seiyō City needed to do disaster restoration work during the western Japan heavy rain in 2018. Therefore, it was difficult to transmit information and preserve the geosite as a geopark.
