1. Kyoto University

Recently, space agency, such as NASA and JAXA, has the plan to send human to Moon or Mars. And, astronauts must spend time in closed environment during human space mission. So, we need to know the mental or emotional changes during space mission. Therefore, it is very important to understand how we are affected during space staying and what we should do for staying in other planets. To recognize the important factors for future space mission, we, Unit of Synergetic Studies for Space (USSS) at Kyoto University, performed an intensive summer space program entitled as Space Camp at Biosphere 2 (SCB2) on 5-10 August, 2019. In this program, USSS collaborated with University of Arizona. In this time, 5 students were selected as participants from Kyoto University and University of Arizona, respectively. So, total 10 students participated this Space Camp.
