In those several years have remarkable new deployment of a sensing tool and technology. The direct sensing based on the data base such as the google earth and world imagery is also getting popular. Our groups accumulate a number of field investigation experiences of world mangrove forests in last half century.

The team are carrying the data base construction by GIS and World Imagery. We like to explain the current result of the Indochina coast mangrove mapping as the case study.

Keywords: Mangrove Forest, Whole earth direct sensing, Indochina peninsula
