Recently, Global Warming is drawing attention as a global issue from all over the world. We turn our attention to the reason why Global Warming is caused. Above all, it's interesting that water vapor occupies about 80% of Greenhouse gas functions. So, we are going to explore how to control the temperature of the earth and the possibility, using Greenhouse effect.

Hypothesis

"Changes in water vapor and interrelates with changes in temperature."

Means

- water vapor
- elevation
- sunlight injection
- ultraviolet rays

First, we verify whether the temperature changes from the above.

Second, we consider which circumstance is easy to change temperature through experiments.

Prospects

We would like to make an environment whose temperature is changed artificially, and reconfirm our experiments, from No.1 to No.4.

Keywords: Global warming, Meteorology, Water vapor, Greenhouse effect
