The Magnetospheric Multiscale (MMS) mission has been extremely successful at sampling the microphysics of collisionless magnetic reconnection with unprecedented temporal and spatial multipoint resolution. As this exciting mission moves forward, changes in the MMS spacecraft configuration and evolution of the orbit provide new science opportunities. While MMS continues its prime science objective of observing the physical processes of magnetic reconnection *in situ*, additional outstanding science questions will be addressed by taking advantage of the changed orbit and spacecraft configurations, and via planned conjunctions with other active science missions. The future plans of the MMS mission are presented.

Keywords: Magnetic reconnection, Magnetopause, Magnetosphere
