Dissolved organic nitrogen (DON) represents an essential N pool, and its stable isotopic composition (δ^{15} N) may provide unique insights into marine N cycle. However, few results of DON δ^{15} N have been reported to date in the global ocean. In this study, we will report DON δ^{15} N values in the upper layer waters of the South China Sea (SCS), which is the largest marginal sea west of the Pacific Ocean.

Keywords: South China Sea, δ 15N, DON
