Kitasato University has conducted Cross-cultural Interdisciplinary Case Study since 2016 to educate healthcare professions with the ability to be active worldwide. The interdisciplinary case study provides the students with evidence based medical skill and knowledge, as well as providing social value and an ethical standpoint across countries. The students are encouraged to expand their activity in the diverse social requirements and contribute to their medical and health care. Sixty-seven students from School of Medicine, Pharmacy, Nursing and Allied Health Sciences of Kitasato University and seven foreign universities participated in this case study in 2019. They were assigned to each group (8-9 students from different disciplines), and each group was assigned to one case as a paper patient. They discussed the case about a goal, healthcare that patient should receive and the role of each profession in each group. Additionally, they discussed the health insurance system and social value across countries that may affect the patient care. The students from different background and discipline had a good relationship by discussion and could understand each other. Most of the students thought that they could understand the diverse group, society, culture and values. They could pay attention to others opinion and tried to imagine their thought, then it was the basic experience for interdisciplinary team collaboration in hospital and community pharmacy. This case study is a good opportunity for the pharmacy students to acquire basic knowledge, skill and attitudes in promoting patient health care in the future.
