Dopant-free cyano-substituted spiro-type hole-transporting materials for perovskite solar cells  
(<sup>1</sup>National Institute of Advanced Industrial Science and Technology (AIST), <sup>2</sup>Nippon Fine Chemical Co., Ltd.) ○Nobuko Onozawa-Komatsuzaki,<sup>1</sup> Atsushi Kogo,<sup>1</sup> Takashi Funaki,<sup>1</sup> Masayuki Chikamatsu,<sup>1</sup> Takuro N. Murakami,<sup>1</sup> Daisuke Tsuchiya,<sup>2</sup> Shinichi Inoue,<sup>2</sup> Toshiya Ueno<sup>2</sup>

Two new cyano-substituted spirobifluorene-based hole-transporting materials, **SF27** (*m*-CN) and **SF48** (*o*-CN) were synthesized. These compounds were derived from spiro-OMeTAD analogue obtained by replacing its *p*-methoxy substituent with *p*-*N,N*-dimethylamino groups. The influence of a cyano substituent on the optoelectronic properties, power-conversion efficiencies (PCEs) and charge-transport behavior in mesoporous type perovskite solar cells (PSCs) were studied. PSCs using these new HTMs without doping are fabricated and compared their cell performance with the devices using spiro-OMeTAD. PSCs with non-doped **SF48** exhibited a high PCE of 18.7%, comparable to the reference PSC device with doped spiro-OMeTAD (18.6%).

*Keywords :* Perovskite solar cell; hole-transporting material; dopant-free

ペロブスカイト太陽電池(PSC)は、軽量、フレキシブル低コスト製造等の特徴を持ち、次世代型太陽電池として注目を集めている。今回我々は PSC の構成要素の一つであるホール輸送材料としてビフルオレン骨格を有する **SF27** (*m*-CN) と **SF48** (*o*-CN) を新規に合成し、物性を評価した。これらを用いて PSC を作製し、その性能について調べたところ、**SF48** を用いたセルはドーパントを加えなくても高い効率を与えることがわかった(Figure 1)。更にそれを用いて作製した電池の耐久性について検討した結果、熱的安定性が大きく向上することがわかった。

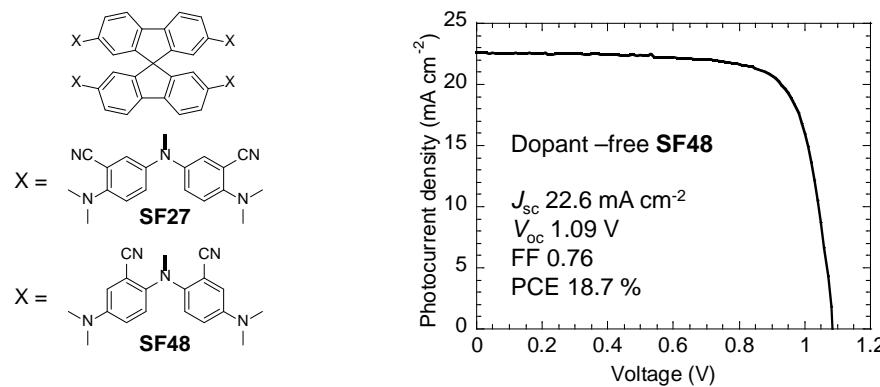

Figure 1. Chemical structures of **SF27** and **SF48**. (a) *J-V* curve measured under AM 1.5G solar irradiance (100 mW/cm<sup>2</sup>) for the highest efficiency solar cell based on non-doped **SF48**. (b)
