**Keywords:** *N*-Sulfonyl-1,2,3-Triazole; Imino carbenoid;  $\beta$ -Diketone; Rhodium catalyst; Ligand effect

Imino carbenoids **I** derived from *N*-sulfonyl-1,2,3-triazoles **1** can undergo useful tandem reactions, because they have a nucleophilic imino group in addition to an electrophilic carbenoid moiety.<sup>1,2</sup> In the present study, we investigated that Rh(II)-catalyzed reaction of *N*-mesyl-1,2,3-triazoles (**1a**) with cyclic  $\beta$ -diketones **2**. Enaminone **3a** was formed as a major product by Rh<sub>2</sub>(piv)<sub>4</sub>-catalyzed reaction of **1a** with **2a–c** (Table 1, Entries 2, 3, and 5). On the other hand, 2,3-fused pyrrole **4ac** were obtained in moderate yield by Rh<sub>2</sub>(hex)<sub>4</sub>-catalyzed reaction of **1a** with dimedone (**2c**) (Table 1, Entry 4). In the case of Rh(II)-catalyzed reactions of **1a** with 1,3-cyclopentanedione (**2e**) or 4-phenyl-1,3-cyclohexanedione (**2d**), carbenoid not-participated reaction proceeded to give triazole skeleton-remained product **5ae** and **5'a**, respectively (Table 1, Entries 6–8).

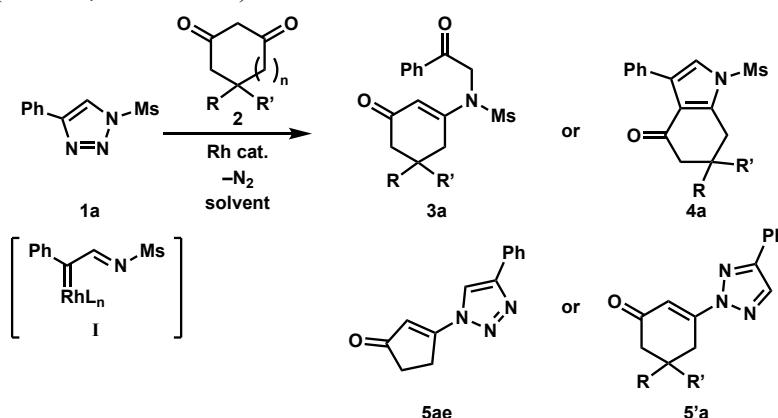

Table 1. Reaction of triazole **1a** with cyclic  $\beta$ -diketones **2** under various conditions<sup>a</sup>

Entry	2	R	R'	n	Rh cat.	Solvent	Temp.	Yield <sup>b</sup> (%)			
								3a	4a	5a	5'a
