Synthesis and Properties of a New Crystal Structure of Hexaazatrinaphthylene (<sup>1</sup>*Graduate School of Science, Okayama University of Science*, <sup>2</sup>*Faculty of Science, Okayama University of Science*, <sup>3</sup>*College of Science, Ibaraki University*) ○Takahiro Oshima,<sup>1</sup> Kazuma Sera,<sup>2</sup> Akiyuki Nakano,<sup>1</sup> Kan Wakamatsu,<sup>1,2</sup> Kiyoshi Fujisawa,<sup>3</sup> Yoichi Tanabe,<sup>1,2</sup> Hideyuki Higashimura<sup>1,2</sup>

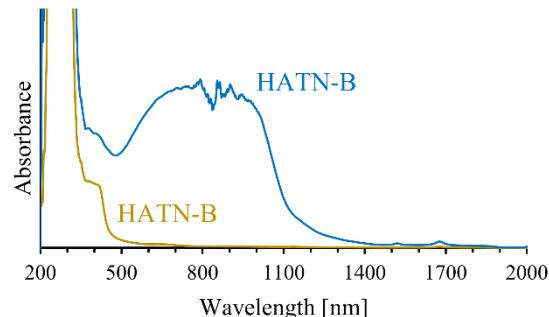

Recently, hexaazatrinaphthylene (HATN) has been applied to organic cathode materials<sup>1)</sup> and multinuclear ligand framework.<sup>2)</sup> As the crystal structure of HATN, only the light yellow structure containing a crystal solvent (HATN-Y) was reported so far. In this work, we somewhat changed the synthetic conditions, and hence obtained a new crystal structure with dark blue color including no solvents at all (HATN-B). Although HATN-Y had an absorption wavelength up to ~600 nm, it was surprising that HATN-B possessed a wide range of absorption wavelength up to near infrared region of ~1400 nm. We will report the detailed results of synthesis, analysis, and calculation of HATN-B.

**Keywords :** Hexaazatrinaphthylene; Crystale strucure; Crystal solvent; Near infrared absorption

近年、ヘキサアザトリナフチレン(HATN)は、多電子を受容可能な有機正極材料<sup>1)</sup>や酸素還元に有利な多核金属錯体の中心骨格<sup>2)</sup>などに用いられている。HATNの結晶構造としては、これまで結晶溶媒を含む淡黄色構造(HATN-Y)のみが報告されていた<sup>1)</sup>。今回、合成条件を少し変更しただけで、結晶溶媒を全く含まない新規の濃青色構造(HATN-B)が得られた。HATN-Yでは約600 nmまでしか吸収を持たなかったが、HATN-Bは驚くべきことに約1400 nmと近赤外領域まで、幅広い吸収を持つことを見出した。本発表では、HATN-Bの合成条件検討や分析・計算の結果を詳細に報告する。
